

Job Assessment — AI-Native Software Developer (Vibe Coder)

Pergamon Labs Limited · Cyberport, Hong Kong

The task

Study who we are and what we do:

- Website: <https://www.pergamon-labs.com/>
- LinkedIn: <https://www.linkedin.com/company/pergamon-labs>

Pergamon Labs builds SaaS AI software that streamlines the creation of technical documentation. Based on your research, **vibe-code a web application that, in your opinion, could be useful to us on our journey of bringing an agentic experience to technical documentation.**

This is deliberately an open task. There is no single correct answer — we want to see what problem you choose, why you believe it matters to us, and how you build. Use of AI coding tools (Claude Code, Codex, Cursor, or similar) is expected and encouraged — that's the way we work.

Keep the scope realistic: we would rather see a small, working, well-reasoned app than an ambitious skeleton.

Deliverables

1. **Source code** — a Git repository (link to a public repo, or a zip including the `.git` folder so the commit history is preserved).
2. **A single Markdown file (`PROPOSAL.md`)** in the repo root, covering the sections below. This document matters as much as the code.

PROPOSAL.md — required sections

1. **The problem** — What problem did you choose and why do you believe it matters to Pergamon? What in our website/LinkedIn led you to this conclusion? (max ~half a page)
2. **What the app does** — The features you built, and equally important: what you deliberately left out of scope and why.
3. **How to run it** — Exact setup and run instructions. We will follow them literally; if the app doesn't start, the assessment stops there.
4. **Architecture and key decisions** — Stack choice, structure, and the 2–3 most important technical decisions with the trade-offs you considered.
5. **How you worked with AI** — Which AI coding tools you used and how: your workflow, examples of prompts or task breakdowns that worked well, at least one case where the AI produced something wrong or misleading and how you caught and fixed it, and what you verified manually before considering the work done.
6. **Honest limitations** — What is weak, hacky, or unfinished in your app. We trust candidates who can see their own gaps.
7. **What's next** — If you joined us and had one more month, how would you evolve this idea?
8. **Time spent** — A rough honest number of hours.

Selection criteria

Your proposal will be assessed by the CTO. We are not looking for a polished product — we are looking for sound problem choice, an effort to understand our business, working software, and a mature AI-assisted development process.

If your idea is interesting and aligned with Pergamon's mission, you will be invited to a face-to-face interview built around your research, your concept, and your building process — expect to explain and defend your decisions live, and to make a small change to your app during the session.
